# Package 'csmtools'

## February 8, 2017

Type Package

Title R code in use in CSM solutions
Version 1.4.5
Author McClelland Legge <mcclelland.kemp@iriworldwide.com> [aut, cre]</mcclelland.kemp@iriworldwide.com>
Maintainer <mcclelland.kemp@iriworldwide.com></mcclelland.kemp@iriworldwide.com>
<b>Description</b> A collection of helpful functions that are widely or commonly used by the organization.
License file LICENSE
LazyData TRUE
RoxygenNote 5.0.1
Imports data.table, magrittr, ggplot2, dplyr, ggthemes, scales
Suggests testthat,
covr, knitr, rmarkdown
VignetteBuilder knitr
R topics documented:

2 dread

csmt	ntools-package csmtools: A collection of us	reful code	
Index	X.		20
	seq		
	pamel		18
	pamat		1′
	ninja_load		
	mread		1:
	make_compare_names		
	make_color		
	iri_week_date		
	iri_week		1

#### **Description**

csmtools is a collection of code that can be used in different projects to help prevent team members from reinventing the wheel for some things that others have already figured out.

#### **Details**

Bug reports, additions and enhancement requests are welcomed at: https://github.com/McClellandLegge/csmtools

dread

Fread all files in a directory

#### Description

Fread all files in a directory

#### Usage

```
dread(dir_path, hive_default = FALSE, ...)
```

#### Arguments

```
dir_path A valid directory pathhive_default A boolean set to FALSE, in which case we use fread. Otherwise when FALSE we use hive_read.... Additional arguments to fread
```

#### Value

A data table

dreads 3

dreads	A function to do multiple directory reads

#### Description

A function to do multiple directory reads

#### Usage

```
dreads(envs, pattern, colnames = NULL, filters = NULL, combine_dir = TRUE,
    combine_env = TRUE, ...)
```

#### **Arguments**

envs	A named list
	<ul> <li>dir_path A character string sepecifying the path of the directory</li> <li>hive A boolean, is this a hive table or a regular file</li> <li>ext Optional, if hive is FALSE, specify if only files with a certain extension should be read, e.gdat or .csv.</li> </ul>
pattern	A regex character string. Only file names which match the regular expression will be returned.
colnames	Any column names for the tables being read in. Note these must be universal so if any of the tables differ, leave this NULL and turn off the combine_* actions as appropriate
filters	Any regex filters to apply, no negation works at this time. Can be passed as a list or vector
combine_dir	A Boolean, collapse the list of data.tables read in from each env into a data.table, keeping the file/table names in the table_name column?
combine_env	A Boolean, collapse the list of data.tables from the different envs into a data.table, keeping the names of the envs in the env_name column?
	Additional arguments to fread

#### Value

A list of data.tables or a data.table

#### See Also

dread

4 dt\_compare

dt\_compare

Merge and compare columns of data.frames (data.tables)

#### **Description**

Merge and compare columns of data.frames (data.tables)

#### Usage

```
dt_compare(x, y, compare = NULL, func = `-`, round = TRUE,
    precision = 6, verbose = TRUE, plot = TRUE, ...)
```

#### **Arguments**

X	A data.frame
у	A data.frame
compare	A character string or vector of shared column names
func	A binary function to compare the columns with, should be appropriate for the datatypes of the columns
round	A boolean, should we round at all?
precision	The precision of the comparison, is the digits argument to the round function
verbose	A boolean, should messages be written to the window?
plot	A boolean, should a summary plot be produced? Requires the loading of additional packages
	Any arguments to the merge function

#### Value

A data.frame

```
x <- iris[1:50,]
y <- iris[1:60,]
x$id <- seq(nrow(x))
y$id <- seq(nrow(y))
y$Sepal.Width = y$Sepal.Width + rnorm(n = nrow(y))

# can specify any arguments to 'merge'
res <- dt_compare(x, y, compare = c("Sepal.Width", "Sepal.Length"), by = "id", all.y = TRUE)</pre>
```

dt\_reduce 5

dt\_reduce

Apply a row-wise Reduce

#### Description

Apply a row-wise Reduce

#### Usage

```
dt_reduce(DT, FUN, ...)
```

#### **Arguments**

DT A data.table

FUN Any binary function

... Quoted column names from DT

Apply a row-wise reduce for a given function on a set of a data.table's columns. The main advantage of this function is that names can be passed to the function as vectors, eliminating the need to hard code differencing, etc. based on column names. Additionally, the output is specified by the user – often we want to perform a calculation and have vector output, something usually implemented with an ugly unlist.

#### Value

**Details** 

A vector

Class will vary

```
library("data.table")
DT <- as.data.table(head(iris))
# basic differencing
dt_reduce(DT, `-`, "Sepal.Length", "Sepal.Width")

# paste columns together row-wise
dt_reduce(DT, paste, colnames(DT))

# calculate the mean
dt_reduce(DT, `+`, "Sepal.Length", "Sepal.Width", "Petal.Length") / nrow(DT)</pre>
```

6 filter\_files

file	size	filter
1110	_5120_	_

Filter files based on their size

#### **Description**

Filter files based on their size

#### Usage

```
file_size_filter(x, size = 0, units = "B", include = FALSE)
```

#### **Arguments**

X	A character vector of filenames
size	A numeric vector, the size of the file
units	A character vector specifying the units. Options are ${\tt B}$ , KB, MB and GB. Must match the length of size if specifying more than one unit.
include	A boolean, include files of size size?

#### **Details**

Filters out the files that are less than (or less than or equal to) the size with units specified. If all files are filtered out, then a character vector of length 0 is returned.

#### Value

A character vector

#### **Examples**

```
x <- list.files(path = Sys.getenv("TEMP"), full.names = TRUE)[1]
file_size_filter(x, size = 1, units = "KB")</pre>
```

filter\_files

Filter out file names based on criteria

#### Description

Filter out file names based on criteria

#### Usage

```
filter_files(x, size = 0, units = "B", include = FALSE, simplify = TRUE)
```

floor 7

#### **Arguments**

X	A character vector of filenames
size	A numeric vector, the size of the file
units	A character vector specifying the units. Options are B , KB, MB and GB. Must match the length of size if specifying more than one unit.
include	A boolean, include files of size size?
simplify	A boolean, should we create a data.table from the list of output?

#### **Details**

Automatically excludes any non-existant items

#### Value

```
A list or a data. table
```

#### **Examples**

```
# single file size and unit specification
x <- list.files(path = Sys.getenv("TEMP"), full.names = TRUE)[1:100]
filter_files(x, size = 1, units = "KB")

# multiple specifications
size <- c(0, rep(1, 4))
units <- c("B", "B", "KB", "MB", "GB")
res <- filter_files(x, size, units)
res$min_file_size <- factor(res$min_file_size, levels = paste(size, units))
table(res$min_file_size)</pre>
```

floor

A function to extend the functionally of the base::floor function

#### Description

A function to extend the functionally of the base::floor function

#### Usage

```
floor(x, digits = 0)
```

#### **Arguments**

x A numeric

digits The number of digits to the left of the decimal place to round to

#### **Details**

Usually used for purchase data when you need to floor the cents

#### Value

A numeric

has\_hive

#### **Examples**

```
x <- 99.9999
floor(x, 2)
# is equivalent to:
base::floor(100 * x)</pre>
```

gg\_color\_hue

Emulate the default ggplot2 color palette

#### **Description**

Emulate the default ggplot2 color palette

#### Usage

```
gg\_color\_hue(n, rgb = TRUE)
```

#### **Arguments**

n The number of colors to produce

rgb A Boolean, should a rgb(<r>, <g>, <b>) character string be returned instead

of the hex values?

#### **Details**

An adapted function from John Colby's http://stackoverflow.com/a/8197703/3034614 on how to emulate the ggplot2 default color palette, which is just equal spacing on the color wheel.

#### Value

A character vector

#### Examples

```
gg_color_hue(5)
gg_color_hue(5, rgb = FALSE)
```

has\_hive

Check if the system has hive capabilities

#### Description

Check if the system has hive capabilities

#### Usage

```
has_hive()
```

#### Details

Checks to see if the hive binaries are in the PATH variable

hive\_datatypes 9

#### Value

A boolean

#### **Examples**

```
if(has_hive()) {
    print("yes")
} else {
    print("no")
}
```

hive\_datatypes

Extract the R-datatypes for a hive table

#### Description

Extract the R-datatypes for a hive table

#### Usage

```
hive_datatypes(schema, table_name)
```

#### **Arguments**

schema A character string, the name of the hive schema table\_name A character string, the name of the hive table

#### **Details**

For now the functions converts all number-y datatypes like integer, float, decimal to numeric and both date and string types to character.

#### Value

A data. table with columns:

- name The column name (character)
- type The R-datatype (character)

10 hread

hive\_read

Read a Hive table that is stored as a text file

#### **Description**

Read a Hive table that is stored as a text file

#### Usage

```
hive_read(x, ...)
```

#### **Arguments**

x A character string, the directory path of the hive table to read

... Additional arguments to fread

#### **Details**

The function allows you to assign your own additional arguments to fread, but it defaults the separator to pipe ("I") and adds to the na.string to recognize the hive default.

#### Value

```
A data.table
```

hread

A function to perform a read of a hive table

#### **Description**

A function to perform a read of a hive table

#### Usage

```
hread(table_name, schema, schema_loc, ...)
```

#### **Arguments**

table\_name A character string, the name of the hive table schema A character string, the name of the hive schema

schema\_loc A character string, the directory path of where the schema is located on the

**HDFS** 

... Additional arguments to hive\_read

#### **Details**

Will automatically read all files under the directory after finding the datatypes and column names from the hive metastore. Note that the schema can have a different physical location instead of being forced to have the schema\_loc/schema naming convention.

iri\_week 11

#### Value

```
A data.table
```

#### **Examples**

```
## Not run:
schema_loc <- "/mapr/mapr03r/analytic_users/msmck/csm_synd_hive_schemas/csm_syndicated/"
hread("dictionary", "csm_syndicated", schema_loc)
## End(Not run)</pre>
```

iri\_week

A function to derive the IRI week for the date specified

#### Description

A function to derive the IRI week for the date specified

#### Usage

```
iri_week(x, fmt = "%Y-%m-%d", ...)
```

#### **Arguments**

x A date or character string

fmt A date format

... Additional arguments to as. Date including further arguments to be passed from or to other methods, including format for as. character and as. Date methods.

#### Value

A numeric

#### See Also

```
iri_week_date
```

```
iri_week(Sys.Date())
iri_week("Dec. 12, 2016", "%b. %d, %Y")
```

is\_defined

iri_week_date	A function to derive the week-ending or week-begining date for an IRI
	week

#### Description

A function to derive the week-ending or week-begining date for an IRI week

#### Usage

```
iri_week_date(x, week_ending = TRUE)
```

#### **Arguments**

x An IRI week

week\_ending A boolea

A boolean, should we return the date for week-ending (TRUE) or week-beginning (FALSE)

#### Value

A Date

#### **Examples**

```
iri_week_date(1900, week_ending = FALSE)
```

is\_defined

A function to perform a read of a hive table

#### **Description**

A function to perform a read of a hive table

#### Usage

```
is_defined(..., .all = FALSE)
```

#### **Arguments**

... A list of objects to test if they are null

.all Boolean, should we return the tests for each individual element?

#### **Details**

Good for testing an input(s) to a function when it might be NULL

make\_color 13

#### **Examples**

```
foo <- function(x = NULL, y = NULL) {
  if (is_defined(x, y)) {
    return(paste0(x, y))
  } else if (is_defined(x)) {
    return(x)
  } else if (any(is_defined(x, y, .all = TRUE))) {
    return("one is not null")
  }
}
foo(x = 1)
foo(x = 1, y = 2)
foo(y = 2)</pre>
```

make\_color

A function to convert colors to their hex values

#### Description

A function to convert colors to their hex values

#### Usage

```
make_color(...)
```

#### **Arguments**

. . . A (possibly) mixed-type vector

#### **Details**

A list is returned instead of a vector to avoid the coercion of a Boolean value to a character one

#### Value

A list of hex values or Boolean FALSE when the element cannot be interpreted as a color

```
make_color(NA, "black", "blackk", 5, "#00", "#000000", "rgb(1, 1, 1, 0.5)")
```

14 make\_upc

make	compare	names
marc	Collibat C	Hallics

Make names for comparing two data sets

#### **Description**

Make names for comparing two data sets

#### Usage

```
make_compare_names(compare, suffixes = c(".x", ".y"), sep = "_")
```

#### Arguments

compare The column names to compare suffixes The suffixes for each set to use

sep The separator between the names, the sep argument to the paste function

#### Value

A character vector

#### **Examples**

```
make_compare_names(compare = c("dollars", "units"), suffixes = c(".hive", ".sas"))
```

make\_upc

Make a upc form component parts

### Description

Make a upc form component parts

#### Usage

```
make_upc(sys, gen, ven, ite, format = "sgvi")
```

#### **Arguments**

sys	A vector that can be coerced to integer
gen	A vector that can be coerced to integer
ven	A vector that can be coerced to integer
ite	A vector that can be coerced to integer

format A character string with the four letters "s", "g", "v", and "i" arranged in the

desired format of the outout, e.g. 'svig'

#### Value

A character vector

mread 15

#### **Examples**

```
set.seed(1)
sys <- rep(0, 5)
gen <- rep(1, 5)
ven <- sample(10000:99999, 5)
ite <- sample(10000:99999, 5)
make_upc(sys, gen, ven, ite, format = "sgiv")</pre>
```

mread

"Meta-read": Read a file with an accompanying meta file

#### **Description**

"Meta-read": Read a file with an accompanying meta file

#### Usage

```
mread(filepath, metafilepath = NULL, ...)
```

#### **Arguments**

filepath The file path of the file to be read

metafilepath Default NULL, the file path of the meta file. Assumes the file is in the same

directory and has an identical naming convention

... Other arguments to fread

#### **Details**

Silently assigns the meta table to the global environment

#### Value

A data.table object

ninja\_load

Load packages silently

#### **Description**

Load packages silently

#### Usage

```
ninja_load(...)
```

#### **Arguments**

... The quoted names of the packages you wish to load with deadly silence

paman paman

#### **Examples**

```
# load some notoriously loud packages
## Not run:
ninja_load("data.table", "bit64")
## End(Not run)
```

paman

Element-wise paste of a matrix using the column names

#### Description

Element-wise paste of a matrix using the column names

#### Usage

```
paman(x, ...)
```

#### Arguments

x A matrix, or object able to be coerced to a matric with non-null dimnames

... Arguments to paste

#### **Details**

Works just like a normal paste0 function except the input is expected to be a matrix and the output will likewise be a matrix. Its a "paste" for a "matrix" "element" = "pa" + "m" + "el" = "pamel". Helpful for parsing hovertext for 3D plotly objects.

#### Value

A matrix

#### See Also

pamat pamel

```
m <- matrix(runif(9), nrow = 3, dimnames = list(LETTERS[1:3], LETTERS[4:6]))
paman(m, "From: ", y, " to: ", x)
paman(m, "From: ", x, " to: ", y)</pre>
```

pamat 17

pamat

Element-wise paste of two (or more) matrices with a separator

#### **Description**

Element-wise paste of two (or more) matrices with a separator

#### Usage

```
pamat(..., sep = " ")
```

#### **Arguments**

... Matrix objects

sep A character string, the separator between the element-wise paste

#### **Details**

The matrices will be pasted together in the order in which they are specified and one separator will be shared used. Its a "paste" for a "matrix" "element" = "pa" + "m" + "el" = "pamel". Helpful for parsing hovertext for 3D plotly objects.

#### Value

A matrix

#### See Also

pamel paman

#### **Examples**

```
caps <- matrix(LETTERS[1:9], nrow = 3)
lows <- matrix(letters[1:9], nrow = 3)
pamat(caps, lows, sep = " -> ")
```

pamel

Element-wise paste of a matrix

#### **Description**

Element-wise paste of a matrix

#### Usage

```
pamel(n, ...)
```

18 preview\_palatte

#### Arguments

n The number of rows of the incoming/outgoing matrix

One or more R objects, to be converted to character vectors. Expecting that this contains the matrix object, but that is not strictly enforced.

#### **Details**

Works just like a normal paste0 function except the input is expected to be a matrix and the output will likewise be a matrix. Its a "paste" for a "matrix" "element" = "pa" + "m" + "el" = "pamel". Helpful for parsing hovertext for 3D plotly objects.

#### Value

A matrix

#### See Also

pamat paman

#### **Examples**

```
m <- matrix(runif(9), nrow = 3)
pamel(nrow(m), "Value: ", round(m, 4), " units")</pre>
```

preview\_palatte

Preview your hex color palatte

#### **Description**

Preview your hex color palatte

#### Usage

```
preview_palatte(x)
```

#### **Arguments**

Х

A vector of hex colors

#### **Details**

Plots a simple image with swaths of the colors specified in the palatte, in the order in which they are specified

```
colfunc <- colorRampPalette(c("white", "dodgerblue"))
my_cols <- colfunc(20)
preview_palatte(my_cols)</pre>
```

seq\_ 19

seq\_

Extension of base::seq to handle range specification

#### **Description**

Extension of base::seq to handle range specification

#### Usage

```
seq_(range, ...)
```

#### Arguments

range A numeric vector of length two specifying the 'from' and 'to' arguments to the

seq function

... Other arguments passed to seq

#### Value

A vector

#### **Examples**

```
seq_(range(1:10), by = 2)
```

split\_upc

Split up a character UPC

#### **Description**

Split up a character UPC

#### Usage

```
split_upc(upc, format = "sgvi", convert = FALSE)
```

#### Arguments

upc A character vector

format A character string with the four letters "s", "g", "v", and "i" arranged in the

format of the input upc, e.g. 'svig'

convert A boolean, should the final component pieces be converted to numeric?

#### Value

A named list of the component pieces

```
upcs <- c("0000790350211", "0007403067401", "0010248198421")
split_upc(upcs, format = "svig", convert = TRUE)</pre>
```
